Lecture #8 Recursion I

Open Source vs Free vs Proprietary Software

- Open Source SW – "Free" as in no cost
- Free SW – "Free" as in Freedom
- Proprietary SW – closed source and costs $$
- Why Open Source and Free?

www.nist.gov/dads/HTML/recursion.html

- Recursion: (noun) See recursion.
- *An algorithmic technique where a function, in order to accomplish a task, calls itself with some part of the task*
- Recursive solutions involve two major parts:
  - Base case(s), the problem is simple enough to be solved directly
  - Recursive case(s). A recursive case has three components:
    - Divide the problem into one or more simpler or smaller parts
    - Invoke the function (recursively) on each part, and
    - Combine the solutions of the parts into a solution for the problem.
- Depending on the problem, any of these may be trivial or complex.

Trust the Recursion

- When authoring recursive code:
  - The base is usually easy: "when to stop?"
  - In the recursive step
    - How can we break the problem down into two:
      - A piece I can handle right now
      - The answer from a smaller piece of the problem
    - Assume your self-call does the right thing on a smaller piece of the problem
    - How to combine parts to get the overall answer?
- Practice will make it easier to see idea

Recursion Versus Iteration

- Recursion is ___ Iteration (i.e. loops)
  a) more powerful than
  b) just as powerful as
  c) more powerful than
  d) just as powerful as

Summary

- Behind Abstraction, Recursion is the 2nd biggest idea about programming in this course
- Format (usually) is 2 cases:
  - Base Case
  - Recursive case
    - Divide, Invoke, Combine
- It's most useful when the problem is self-similar
- It's no more powerful than iteration, but often leads to more concise & better code
